

FWD PROJECT

Problem Statement

Finding reliable and well organized information about travel destinations across different countries is often difficult. Travelers usually need to visit multiple websites to understand places, culture, attractions, and travel basics, which makes exploration time consuming and confusing.

This matters because many users especially students and young travellers look for a single platform to explore the world easily before deciding where to travel. When information is scattered or poorly presented, users lose interest and miss opportunities to discover new destinations.

The aim of this project is to develop a responsive travel website that provides clear and structured information about travel destinations from different countries. The objectives are to support world exploration through simple navigation, device compatibility, and an easy to understand presentation of destination details.

Target Audience

1.Primary Users

- Students and young adults
- First-time and budget travellers
- Solo travellers and small groups

2.Secondary Users

- Working professionals planning short trips
- Casual travellers seeking destination inspiration

3. Access Type

- Mobile users, Tablet users, Desktop users

Technology Stack

- HTML5** – Semantic structure and define content styling.
- CSS3** – Layout design, responsiveness, animations, and media queries.
- JavaScript (JS)** – Client side interactivity and dynamic behaviour.
- Browser Testing** – Google Chrome, Mozilla Firefox, Microsoft Edge.
